IVAN WONG

https://icwong.github.io · (778) 863 - 8728 · icwong@sfu.ca · Burnaby, B.C, Canada

SKILLS & INTERESTS

Java / Python / C / C++	Pandas / NumPy / PySpark / Hadoop	Ruby on Rails / React
HTML / CSS / JavaScript	NoSQL / PostgreSQL / SQL Server	Git / GitHub / JIRA
RESTful API	Windows / Mac OSX / Linux	Machine Learning / Data Analysis

WORK EXPERIENCE

Quality Assurance Automation Engineer Co-op *September 2016 – April 2017*
Absolute Software Corporation - Vancouver, B.C

- Practiced **Agile** and **Scrum** in 2 week sprints with 10 other developers
- Created, debugged and ran automation test scripts in **Java, Selenium** and **TestNG** for functional and regression testing
- Optimized various Java web traffic data scraping tool using hash map resulting in 1 hour decrease in the fetching process
- Designed, executed and analyzed performance testing scripts using **JMeter** and **LocustIO** to detect performance bottlenecks
- Improved problem solving, debugging skills and **OOP** principles by working on their large code base, fixing its bugs and improving their exception handling for future debugging

COMPETITIONS AND PROJECTS

github.com/icwong

Anomaly Detection for Power Consumption Data – Python *January 2018 – Present*

- Detection of power consumption anomalies by using Density-, Clustering-, and SVM-Based anomaly detection techniques
- Partitioned complex datasets into smaller subsets by defining various time windows to train one **Hidden Markov Model** for each time window using **Python Scikit-learn** package

Cryptocurrency Neural Networks Prediction Trading App – React Native *January 2018 – Present*

- Developing a native application using React Native that incorporates **deep learning neural networks** to predict future cryptocurrency value based on historical trends in the pricing and trading volume
- Scraping live feed data from various websites for prices and volatility by parsing their web pages

Machine Learning Weather Forecast Prediction – Python *September 2017 – December 2017*

- Structured and cleaned quantitative weather data for data classification analysis to predict the weather forecast from an image using machine learning pipelines. Techniques: Naïve Bayes, Nearest Neighbors, Support Vector Machines and Decision Trees.
- Implemented **Python**'s **Pandas, NumPy** and **Matpotlib** libraries to conduct data exploration and data visualization
- Involved data loading into the **Hadoop** Distributed File system to compute models, resulting in a ~3x data processing speed
- Extracted the image pixel colors: Red, Yellow and Blue, using Python Sci-kit image to train the model

Facebook Hacker Cup 2017 (facebook.com/hackercup) *January 2017*

- Developed problem solving skills through completing their programming puzzle

COOPR&S (cooprs.herokuapp.com) – Ruby on Rails *May 2016 – August 2016*

- Developed a **Ruby on Rails** web application with three other classmates, that allow students to share their co-op experience and for companies to promote their co-op opportunities
- Architected the model-view-controller to respond to user inputs and perform interactions on data model objects

Various Web and Game Projects – Ruby on Rails + Python *January 2015 – August 2016*

- Full stack development to create a SFU Fantasy Sports Club website using Ruby on Rails and SQLite
- Created a Python game that allows the user to move on a x by y grid to collect points, while avoiding trap holes

EDUCATION

Simon Fraser University - Burnaby, B.C *September 2013 – December 2018 (Expected)*
Bachelor of Science in Computer Science, Major GPA: 3.03
